

Research about Smartphones

Hook + intro + thesis: Smart phones are an important technology nowadays. It helps people text, call, research information, work and talk to others quickly. People can also watch videos and play games on phones. It is important because it helps people stay in contact.

Smartphones have changed how people communicate with others because they allow people to communicate faster and easier. B1: The first iPhone was made by Steve Jobs and Apple in 2007. It was made to carry communication and internet access in one device. The iPhone helps solve the problem of bringing many devices by just bringing a phone. The first version had a touchscreen, a home button, and a simple design compared to the iPhone now ("Who Invented the iPhone"). B2: Over time, the iPhone has had many improvements. Apple added a better camera, bigger screen, and many colors for the iPhone. New features such as face id, Siri and improved image processing. People wanted to change it because they wanted to make smartphones more convenient and useful ("The History of Apple iPhones").

B3: Nowadays, iPhone is used by all people in the world. People use it to text, call, find information, work, and play games. Technology helps people contact others although they live far away. The benefits of smartphones are that they can search for information quickly and stay in contact with friends by texting or calling. ("Pew Research Center").

Conclusion: In conclusion, technology is important because it helps people communicate easily and conveniently in finding information. Technology has changed communication by letting us call, video call and text. Everyone will disconnect with their friends who live far away; finding information or studying will be a challenging problem for all people. The most interesting thing that I learned is how much the first iPhone has changed since 2007.

Smartphones play an important role in our lives.
